Dear Sir/Madam,

This is Barry from JLS-China, we are professional manufacturer in LED indoor and outdoor lights.

We would like to introduce the best features, solar street light to you, the reasons you choose our LED solar street light is:

1. This is a fully self-contained system of light, panel, batteries and controller, so you don't need AC input at all, which eliminates the need for cable trenching and connecting. So of course the light NEVER consumes AC power at all.
2. With Dual Axis rotation, the system enables you to quickly and easily install the fixture with complete flexibility to fully catch the maximum amount of sunlight. Also, the panel being separated like this means the lighting fixture runs much cooler from being shaded by the panels, as well as the fixture being able to have a much larger heatsink area.
3. With PIR sensor, the system can detect movement, when detect movement which will the light to 100% brightness, then if no more detection for 1 mins, LED light will turn back to energy saving mode (10%-30% brightness)
4. The system fully charge for 7 hours can work for 3 days with 8 hours a day without sun. So under normal conditions, only 30% of the battery will be used each night which greatly extends the lifetime of the battery, and the full recharge then only needs less than 2.5 hours

Item applications include: Residential district road and pathways, parks, public building exteriors, carparks, hospital and school grounds, remote and off grid uses, infrastructure such as sewage treatment plants, waste recycling centres, etc..

Any more question as our product, please don't hesitate to contact with us in freely.

---

Best Regards

Barry
